Ruta Clara | Week 13 technical development record

Fernanda Espinosa | 5 November 2026

Transcript boundary - read first

This is a faithful technical record of this build session, not the full verbatim development back-and-forth required by the assignment. The full chat, including the original user assignment, assistant messages and tools, must be exported and appended before submission. No invented dialogue or absent real-user evidence is supplied as a substitute.

Inputs and interpretation

User supplied Week 13 Business Bending instructions, Team Blueprint and Technologist Brief. Requirements include packet before code, generated mockup, Mermaid flow and actor lanes, same stack plus feedback mechanism, >=5 commits, >=2 deployments, mechanical bug/fix/redeploy, fresh-context screenshot persona test, five humans including >=3 strangers, 3:30 video and security floor.

Read attached PDFs locally. Blueprint chooses SkillProof primary but explicitly declares Fernanda's individual evidence-linked Ruta Clara slice. Preserve that scope and the shadow against false reassurance. Current Week 12 Packet status page read: Vercel and Supabase email-link storage supersede historical Sites architecture; Google and real domain remain unmet.

Source discovery

Recovered exact migrated Next.js source at the prior workspace project. Inspected CloudSession and handoff rules; preserved existing login/save implementation and database schema. Verified current Vercel deployment READY before changes. GitHub repo later found at mfespinosa21/ruta-clara; it contains Week 12 PDFs and source archive, not previously unpacked application source.

Packet and implementation prompt

Wrote docs/PACKET.md and docs/IMPLEMENTATION_PROMPT.md. Committed 6f05598 before app edits. Packet fixes exact user, bounded success, conceptual generated image, Mermaid flow/swimlane, Unite Us benchmark with official source, three-sentence long view, scope, stack, security, mechanical/persona/real-user protocols and commit plan. Image requested before implementation, completed later and embedded as mockup-week13.png. Conceptual image dates/tabs are illustrative.

Development decisions and changes

30725ca: anonymous event mechanism (whitelisted action, step and elapsed ms), last 200 events, in-memory only, JSON export, confusion marker and clear. No typed content, account ID, email or report included.

6a2b7e3: attributed evidence category/recorder/explicit fictional attestation; advancement matches current step. Route changes invalidate acceptance and later progress. Correction can reopen any completed step. Restoring historical copies resets verification to step zero conservatively; saves require explicit user action and do not modify old copies. No real truth verifier implemented.

Deployment 1 dpl_2GMtWpmE2bTvs7RW2RFRmMfisZ7b reached READY on existing project and alias.

Mechanical adversarial finding and fix

Before edits, ran validDate('2026-99-01'): RangeError, Invalid time value. Eight Node test groups initially gave 7 pass / 1 fail. e9e7041 adds typeof and finite-time guards before ISO conversion. Repeat: 8 pass / 0 fail. Source tests also cover invalid/leap dates, missing input, overdue dates, attendance category, attestation/lengths, route freshness/future time, event privacy/cap and storage-bound provenance.

Browser verification and synthetic test

On live publication, extraction logs event 1, creation event 2, fictional contact advance event 3 and progress 1/4; unsupported next step remains disabled. No account sign-in or actual clinical action. Two real screenshots passed sequentially to a fresh-context synthetic persona agent, which saw screenshots without source and narrated as fictional Mariana. Operator clicked controls; the persona's attempted actions were narrated, not independent browser execution.

Quote: "Aquí dice verificación ficticia confirmada, pero abajo la ruta sigue pendiente. Si registro, ¿ya estoy diciendo que la institución sí la recibe?"

Second-screen quote: "Otra vez dice reportado, aún sin verificar. ¿Lo que acabo de guardar no quedó verificado? ¿O habla de la institución?"

1878c55 fix: name exact current step, state previous evidence remains, explain pending route and required inputs, display human-readable verification time in Mexico City. Add click-time guards and DECISIONS.md Session Close. Second deployment requested as dpl_9ouVi9Hcwcr1hd2vDkRogixRCii2. Final deployment/browser/retest results appended separately after verification.

Security inspection and unresolved requirements

Read-only Supabase metadata confirmed RLS enabled and authenticated owner policy with USING/WITH CHECK auth.uid()=owner_id. No row contents read and no DB changes made. Advisor warns leaked-password protection disabled; UI uses email-link login, not passwords. Google sign-in remains unmet, no access was bypassed. Fictional seeds and simulated AI labels retained.

GitHub create-tree write returned 403 Resource not accessible by integration despite readable repo. No remote commits/push claimed; local five-commit history preserved in the source bundle.

Five human sessions, three strangers, user pain ranking, real #1 user fix and retest/return action, matched economics, real domain, Google, GitHub synchronization, full transcript and student-recorded video remain pending.

Final continuation

Second deployment reached READY. Live browser walkthrough completed four fictional steps, blocked appointment-category evidence at attendance, permitted explicit fictional closure, and reopened acceptance to 1/4 with dependent evidence removed. Separate persona agent read third screenshot and understood the scope-specific contact wording; retained long-copy and institutional-step coverage concerns. Additional mechanical display inconsistency fixed in 60c7a00: checkbox alone no longer produces confirmed label unless evidenceReady also passes. Third deployment requested as dpl_FHkji5W3GmH2hb8FCxUwsA8K9NFZ. Eight regression groups still pass. Source and local history included in handoff because GitHub connector write is blocked.

Final deployment 3 verified READY: dpl_FHkji5W3GmH2hb8FCxUwsA8K9NFZ, source 60c7a00, same current live alias.

Week 13 verification record

5 November 2026 | fictional data only

Mechanical pass actually executed

Inherited validDate('2026-99-01') reproduced RangeError: Invalid time value before modification. Regression suite initially: 7 groups pass, 1 fails. After finite-date guard: 8 groups pass, 0 fail (Node test runner). Checks: invalid/normalized/leap dates; missing owner/source; past/future/completed deadlines; attendance category mismatch; recorder/attestation/source bounds; stale/future route; event whitelist/cap; provenance length. These test shared functions, not every UI transition, server rule or cross-account isolation.

Browser actions actually executed on first publication

Opened same live Vercel alias. Ran simulated extraction; event count became 1. Reviewed eight fields; created referral; event count became 2. Missing route and closure remained pending. Entered fictional contact source and recorder, checked attestation, advanced: progress 1/4 and event count 3, category automatically became institutional acceptance, advance disabled pending required inputs. Captured two actual screenshots for separate fresh-context synthetic persona walkthrough. No signed-in save, email request or real clinical action performed.

Security inspection

Supabase metadata: referral_sessions RLS=true. ALL policy for authenticated requires auth.uid()=owner_id in USING and WITH CHECK. No data rows read. Security advisor reports leaked-password protection disabled; current UI uses email links, no password login. This warning remains open. Google OAuth remains unmet. No DB/schema/policy changes this session. Source review: no secret values, environment references only.

Deployment evidence

1. dpl_2GMtWpmE2bTvs7RW2RFRmMfisZ7b READY, source 6a2b7e3. Same project prj_JiFK0jXldpWsKNHa2kcATuaAyAet and ruta-clara-pied.vercel.app alias.

2. dpl_9ouVi9Hcwcr1hd2vDkRogixRCii2 requested from source 1878c55, date fix and persona clarification included. Final status must be recorded after tool verification.

Uncompleted gates

Five real users (>=3 strangers/no classmates), ranked pains, observed #1 user fix/retest/return action, matched manual economics, Google login, real domain, GitHub push, student video, full verbatim chat export. No results invented. Current vercel.app subdomain does not meet the real-domain course rule.

Second-publication browser result

Deployment 2 verified READY. Repeated extraction/review/create, advanced contact, acceptance and appointment with fictional provenance. At attendance, selected appointment category: advance disabled and closure disabled. Changed to attendance and fictional receiving confirmation: progress 4/4, explicit attendance checkbox then permitted fictional closure. Corrected acceptance: progress reset to 1/4, later evidence removed and closure disabled. Event log reached 8 with correct/close events. Persona retest read exact-step label correctly, but still found wording long and requested institutional-step coverage.

A presentation inconsistency was observed: the attestation checkbox could make status text say confirmed even with a mismatched evidence category (advance correctly stayed blocked). Follow-up fix ties the label to the same evidenceReady rule. This is an additional observed bug, not a manufactured failure.

Final deployment 3: dpl_FHkji5W3GmH2hb8FCxUwsA8K9NFZ verified READY; source 60c7a00; existing alias unchanged.

Current delivery status | 5 November 2026

This status supersedes pre-build plans without rewriting their historical evidence.

Current app: https://ruta-clara-pied.vercel.app/

Existing repository: https://github.com/mfespinosa21/ruta-clara

Implemented: anonymous event log/export; attributed fictional evidence and category checks; route-freshness gate; correction from any completed step; conservative reverification after loading historical copy; date exception fix; clearer step-specific labels after fresh-context synthetic screenshots.

Evidence: six meaningful local Week 13 commits (packet before code), eight passing Node test groups, three verified READY deployments (including final display-fix publication), actual browser closure/reopening/category-block checks, fresh-context synthetic three-screen walkthrough and retest. Deployment IDs and final status are recorded with the handoff.

Limits: GitHub rejected source writes (403); existing repository is accessible but does not yet contain this Week 13 source/history. Source ZIP includes a Git bundle for transfer. Google sign-in and real custom domain remain unmet; current URL is a Vercel subdomain. Auth/persistence are inherited and not retested signed-in this week; RLS/policy metadata checked. Security advisor has leaked-password-protection warning; email-link UI does not use passwords. No real users, matched economics, observed pain ranking/return action, complete verbatim chat export or student video supplied. The precise Crystal Ball Brief remains unavailable; supplied Team Blueprint shadow conditions are addressed explicitly.

Do not submit this package as fully complete. The assignment's real-domain requirement is especially consequential.
