Ruta Clara | Current delivery status

1 November 2026 | Fernanda Espinosa | Week 12. This page supersedes earlier infrastructure and access-status statements in the attached historical build documents.

Current live prototype

https://ruta-clara-pied.vercel.app
Vercel production deployment: dpl_H5M8An5n4GG8nuV2Yx8M7Fimk6Ck. State: READY. React / Next.js / Tailwind. The former Sites URL is historical; use the Vercel URL for the current app and video.

Authentication and persistence

Supabase project ruta-clara is active. The app supports email-link sign-in, saving a fictional tracking copy, loading the latest copy and signing out. The owner-restricted referral_sessions table has RLS enabled; anonymous access is revoked. Security advisors returned no findings at the last check. The report text is not stored. Saved fields are responsible person, deadline, step evidence, route attestation and closure state.

Evidence actually available

The user reported successful email sign-in, saving and recovering the owner/date/progress after reload. A separate database aggregate query returned 3 saved copies; no row contents or account identifiers were read. This supports that records exist, not an independent end-to-end browser or cross-account isolation test. The eight earlier user screenshots show the fictional handoff workflow, protected closure and reopening. The synthetic persona review and its resulting source correction are documented separately; post-fix visual retest remains uncompleted.

Google requirement: unmet

Google OAuth remains disabled because Google Cloud access was blocked by the account MFA prerequisite. Email-link authentication is a working alternative reported by the user; it does not fulfill the assignment requirement for Sign in with Google. No security control was bypassed.

Remaining submission gates

Purchased and connected real domain: pending. Current vercel.app address is a subdomain and does not meet the course URL-of-record rule. Venture-owned identities and GitHub repository/transfer: pending. Existing Sites source history is preserved, but no verified Week 12 GitHub URL exists. Exact Week 12 Crystal Ball/Blueprint shadow-clause compliance: unverified because the brief was not supplied. Full verbatim development transcript: must accompany the technical BUILDCHAT record. Demo video: must be recorded by the student (3 minutes demonstration + 30 seconds mind-change).

Video instructions update

Use the current Vercel URL. Show fictional data only. If demonstrating persistence, sign in through the email link, save the fictional case, reload and load the latest copy. Do not record the email login link or any credential. Describe email access as the current fallback and do not claim Google is working. The previous timed script is an outline; adapt it to the app labels. Do not claim measured 10:1 improvement, real clinical capacity or completed real-user testing.

Submission integrity

These documents preserve completed work and identify incomplete requirements. The presence of all PDF filenames does not make the assignment complete. The real-domain requirement remains especially consequential under the supplied rubric.

RUTA CLARA - Week 12 Build Packet

Fernanda Espinosa | ADVERSARY | 1 November 2026

Authority and packet-before-code

Read CHARTER.md first. This packet precedes Week 12 implementation; the prior Week 5 packet is preserved as PACKET_WEEK05.md. Method step 3 becomes the core: find the next incomplete handoff, give it an owner and deadline, and require verified evidence before completion. Week 12 Crystal Ball and Blueprint conditions are unavailable; their compliance is unverified.

Problem, user and success

A clinic navigator needs to finish a referral but scattered status information hides who must act next. Mariana, a fictional CDMX navigator, operates this prototype; Ana is a fictional beneficiary. Before the module closes, the prototype must show the next incomplete step, validate an owner/deadline, flag actual overdue status, require evidence to advance, and protect closure until attendance is verified. All examples and AI outputs remain explicitly simulated.

Mockup

Generated before implementation. This is a concept, not a screenshot: incidental dates, cardiology text and navigation tabs are illustrative and are not implemented scope. The working prototype retains the original referral scenario.

Feature flow

```
flowchart TD
 A[Open fictional case] --> B[Review stated facts and unknowns]
 B --> C{Owner and deadline valid?}
 C -->|No| D[Show correction]
 D --> B
 C -->|Yes| E[Show next incomplete handoff]
 E --> F{Deadline passed?}
 F -->|Yes| G[Show overdue action]
 F -->|No| H[Show pending action]
 G --> I[Human records evidence]
 H --> I
 I --> J{Evidence valid?}
 J -->|No| E
 J -->|Yes| K[Advance one step]
 K --> L{Attendance verified?}
 L -->|No| E
 L -->|Yes| M[Allow protected closure]
 K --> N[Correction invalidates dependent steps]
 N --> E
```

Actor swimlane

```
flowchart TD
 subgraph Navigator
 N1[Review facts]
 N2[Assign owner and deadline]
 N3[Record evidence or correction]
 end
 subgraph System
 S1[Validate and preserve unknowns]
 S2[Display next step and overdue state]
 S3[Advance or reopen dependent steps]
 end
 subgraph Receiving_institution
 R1[Provide acceptance or attendance evidence outside demo]
 end
 N1 --> S1 --> N2 --> S2 --> N3 --> S3
 R1 -. human verification .-> N3
 S3 --> S2
```

Benchmark line

My selected global product benchmark is Unite Us Closed-Loop Referral System, whose official product page describes referral and service-outcome tracking beyond sending a referral; this is a selected benchmark, not a proven world ranking. Ruta Clara localizes a narrower Spanish-language, human-owned referral workflow for one Mexican clinic, with visible unknowns, deadlines and evidence-protected attendance closure.

Source: https://uniteus.com/products/closed-loop-referral-system/ (reviewed 1 November 2026). No claim of comparable integrations, certification or results.

Long view

In three years this slice could become a protected referral layer for one funded navigation network. Each route would show when eligibility, capacity, documents and cost were last verified. Scaling would require measured benefit and human capacity, with AI retained only if it beats a fixed form at equal accuracy.

Scope cut

Only the inherited core. No real patients, clinical decisions, live messages, booking, payments, new hospital directory or new venture idea. No claim that simulated extraction is a functioning LLM or that the modeled 10:1 ratio has been observed.

Architecture and stack

Layer	Current prototype	Required milestone / gap
UI	Existing React / Next-compatible Vinext / Tailwind	Preserve core and accessible Spanish UI
Rules	Deterministic TypeScript/JavaScript state machine	Test transitions, validation and actual deadline comparison
Data	Fictional in-memory session only	No personal data collection or shared database
AI	Labeled deterministic simulation	No real LLM or benefit claim
Hosting	Existing Sites source and hosting	Vercel under venture identity remains pending
Auth / DB	Not used for fictional session	Supabase + Google Auth + RLS required before personal data
Source	Sites Git repository	Venture GitHub identity and transfer pending
Domain	Existing chatgpt.site subdomain	Purchased real domain not connected

Security floor

No keys needed or committed. No real patient names, reports or other personal data in seeds. Limit every text/date field, validate required values and escape rendering. No user database, external messages or persistent clinical data. This fictional prototype does not demonstrate Supabase Auth or RLS; do not report those checks as implemented.

Tests and evidence policy

Mechanical: missing/whitespace owner; empty or invalid deadline; past versus future deadline; unreviewed and changed facts; missing evidence; step order; premature closure; correction reopens affected and later steps; restart clears state. Preserve at least one observed failure with before/after evidence, fix and redeploy; do not manufacture a bug. Check small-screen layout and keyboard use when preview is available.

Persona: fresh-context synthetic navigator Mariana, 52, paper/WhatsApp workflow, limited time, distrusts AI. Walk ordered actual screenshots, record hesitations and fix the worst. A text review is not the required fresh-chat screenshot test; label any missing procedure honestly. No interview, field test or real-user outcome claim.

Comparison: time manual records, fixed form and assisted flow on matched fictional cases; count setup, correction and maintenance. No measured result yet.

Commit and deployment plan

1 Charter and packet before code. 2 Core next-action rules. 3 UI integration. 4 Mechanical evidence and first deployment. 5 Observed fix, decision log and second deployment. Keep actual commits and deployment IDs, not invented history.

Pending acceptance gates

Real domain; venture identity; GitHub/Vercel/Supabase migration; missing Blueprint/shadow-clause verification; two completed deployments; documented mechanical and fresh-chat persona passes; full development transcript; user-recorded 3:30 video. A working subdomain does not meet the course URL-of-record rule.
