# Ruta Clara | Current delivery status

1 November 2026 | Fernanda Espinosa | Week 12. This page supersedes earlier infrastructure and access-status statements in the attached historical build documents.

## Current live prototype

https://ruta-clara-pied.vercel.app
Vercel production deployment: dpl_H5M8An5n4GG8nuV2Yx8M7Fimk6Ck. State: READY. React / Next.js / Tailwind. The former Sites URL is historical; use the Vercel URL for the current app and video.

## Authentication and persistence

Supabase project ruta-clara is active. The app supports email-link sign-in, saving a fictional tracking copy, loading the latest copy and signing out. The owner-restricted referral_sessions table has RLS enabled; anonymous access is revoked. Security advisors returned no findings at the last check. The report text is not stored. Saved fields are responsible person, deadline, step evidence, route attestation and closure state.

## Evidence actually available

The user reported successful email sign-in, saving and recovering the owner/date/progress after reload. A separate database aggregate query returned 3 saved copies; no row contents or account identifiers were read. This supports that records exist, not an independent end-to-end browser or cross-account isolation test. The eight earlier user screenshots show the fictional handoff workflow, protected closure and reopening. The synthetic persona review and its resulting source correction are documented separately; post-fix visual retest remains uncompleted.

## Google requirement: unmet

Google OAuth remains disabled because Google Cloud access was blocked by the account MFA prerequisite. Email-link authentication is a working alternative reported by the user; it does not fulfill the assignment requirement for Sign in with Google. No security control was bypassed.

## Remaining submission gates

Purchased and connected real domain: pending. Current vercel.app address is a subdomain and does not meet the course URL-of-record rule. Venture-owned identities and GitHub repository/transfer: pending. Existing Sites source history is preserved, but no verified Week 12 GitHub URL exists. Exact Week 12 Crystal Ball/Blueprint shadow-clause compliance: unverified because the brief was not supplied. Full verbatim development transcript: must accompany the technical BUILDCHAT record. Demo video: must be recorded by the student (3 minutes demonstration + 30 seconds mind-change).

## Video instructions update

Use the current Vercel URL. Show fictional data only. If demonstrating persistence, sign in through the email link, save the fictional case, reload and load the latest copy. Do not record the email login link or any credential. Describe email access as the current fallback and do not claim Google is working. The previous timed script is an outline; adapt it to the app labels. Do not claim measured 10:1 improvement, real clinical capacity or completed real-user testing.

## Submission integrity

These documents preserve completed work and identify incomplete requirements. The presence of all PDF filenames does not make the assignment complete. The real-domain requirement remains especially consequential under the supplied rubric.

# PERSONA | Screenshot review

Fernanda Espinosa | Week 12. A fresh-context synthetic reviewer adopted the fictional Mariana persona and inspected eight actual user-supplied screenshots in sequence. This is a simulated screenshot review, not a real-user interview or autonomous interaction with the app. The worst confusion was corrected in source; post-fix visual retest remains pending.

## Persona and task

Mariana, 52, clinic navigator in CDMX; paper and WhatsApp workflow, limited time, slow digital reading, distrusts AI. Task: review an invented report, identify missing data, create an owned referral, record four evidenced steps, protect closure, and reopen a corrected step.

## 1 | Entry - 19:52:37

Synthetic narration: “Entiendo que es un ejercicio y que no debo pegar datos reales. Probaría con el reporte que ya aparece. Ejecutar extracción me cuesta: quisiera saber si sólo va a ordenar el texto o decidir algo por mí.” Finding: clear fictional-data notice; technical extraction label needs explanation. Low predicted abandonment.

## 2 | Extracted facts - 19:53:14

“Unknown no me ayuda; no sé si debo investigarlo, escribir algo o dejarlo así. Además, el transporte se corta y no puedo leerlo completo.” Finding: missing-data label and clipped long value can impede review. High predicted abandonment.

## 3 | Reviewed facts and owner - 19:54:00

“Veo mi nombre y una fecha abajo, pero arriba siguen Unknown y las palomitas. No sé si ya corregí el responsable.” Finding: source facts and assigned operational values are not clearly separated. Route instructions are dense. High predicted abandonment.

## 4 | Route recorded - 19:55:39

“Me tranquiliza que una llamada no cierre el caso. Pero la confirmación no me dice aquí qué institución, qué documentos ni cuánto cuesta; tendría que buscarlo en mi libreta.” Finding: route attestation demonstrates a workflow but does not expose individually verified route values. Remaining prototype limitation.

## 5 | Three steps - 19:56:42

“Falta comprobar que asistió. Pero a la izquierda sigue No confirmada la cita; no sé cuál lado creer.” Highest-priority confusion: report snapshot and current tracker appear contradictory.

## 6 | Protected closure - 19:57:33

“No marcaría esa casilla sólo porque ya tiene cita. Buscaría dónde escribir lo que me dijo recepción; aquí no lo veo.” The screenshot shows three recorded steps, no attendance evidence and disabled closure. Evidence entry may require substantial scrolling.

## 7 | Closed - 19:58:16

“Ahora entiendo que quedó cerrado porque recepción confirmó la asistencia y aparece mi nombre. Pero sigue No confirmada del otro lado y dice que al recargar no se guarda.” Screenshot shows a source-recorded attendance and closed confirmation. No persistence remains explicit; this is a session demo.

## 8 | Reopened - 19:58:53

“Pensaría que se perdió lo que hice o que se reabrió, pero aquí no me explican por qué.” Screenshot shows return to three steps and removal of attendance evidence. It does not show the bottom closure control. The user had been instructed to reopen, so this is guided functional evidence, not independent usability behavior.

## Worst confusion and implemented correction

Source change a7f22b9 distinguishes Datos del reporte original from Seguimiento actual, renames the original appointment field, displays No indicado en el reporte instead of Unknown, explains that Revisado means compared with the report, uses action verbs for the next step, and shows why the case was reopened. These changes address the selected confusion without adding a new feature.

## Verification and limits

Pre-fix evidence: eight ordered screenshots supplied by the user. Mechanical rules: three regression tests passed. Post-fix production compilation is checked separately. Post-fix browser screenshot and repeat persona pass are not completed; do not infer successful understanding from source changes alone. No real navigator was interviewed, no time-saving comparison was measured, no clinical safety or live receiving capacity was established. Remaining concerns: long clipped values, route detail visibility, scrolling, and fictional session-only storage.
